Patent No. 6281200
GENERAL INFORMATION:
APPLICANT: Fife, Kenneth H.
APPLICANT: Krathwohl, Mitchell D.
APPLICANT: Hromas, Robert
APPLICANT: Brown, Darron R.
APPLICANT: Brown, Darron R.
APPLICANT: Brown CHNCTIONAL CHARACTERIZATION OF THE C-C CHEMOKINE-LIKE
TITLE OF INVENTION: MOLECULES ENODED BY MOLLUSCUM CONTAGIOSUM VIRUS TYPES 1
TITLE OF INVENTION: AND 2
TITLE OF INVENTION: AND 2
FILE REFERENCE: INDY:034
CURRENT APPLICATION NUMBER: 60/055,532
EARLIER FILING DATE: 1999-08-18
EARLIER FILING DATE: 1997-08-15
NUMBER OF SEQ ID NOS: 30
SOFTWARE: PatentIN Ver. 2.0

-!- FUNCTION: CHEMOATTRACTANT FOR BLOOD MONOCYTES, MEMORY T HELPER CELLS AND BOSINOPHILS. CAUSES THE RELEASE OF HISTAMINE FROM BASOPHILS AND ACTIVATES EOSINOPHILS.

-!- FUNCTION: Secreted.

-!- TISSUE SPECIFICITY: T-CELL AND MACROPHAGE SPECIFIC.

-!- SIMILARITY: BELONGS TO THE INTERCRINE BETA FAMILY (SMALL CYTOKINE C.C.) (CHEMORINE CC).

Submitted (FEB-1994) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: CHEMOATTRACTANT FOR BLOOD MONOCYTES, MEMORY T HELPER
CELLS AND EOSINOPHILS. CAUSES THE RELEASE OF HISTAMINE FROM
BASOPHILS AND ACTIVATES EOSINOPHILS (BY SIMILARITY).

-!- SUBCELLULAR LOCATION: Secreted.

-!- SUBCELLULAR LOCATION: Secreted.

-!- SIMILARITY: BELONGS TO THE INTERCRINE BETA FAMILY (SMALL CYTOKINE C-C) (CHEMOKINE CC).

Mori S., Goto K., Goto F., Mutakami K., Ohkawara S., Yoshinaga M.;

"Dynamic changes in mRNA expression of neutrophils during the course of acute inflammation in rabbits.";

Int. Immunol. 6:149-156(1994).

-!- FUNCTION: MONOKINE WITH INFLAMMATORY AND CHEMOKINETIC PROPERTIES (BY SIMILARITY).
                                                                   Blanco J.C., Pletneva L.M., Prince G.A.;
"Sigmodon hispidus cytokines, chemokines and interferons.";
Submitted (SEP-2001) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: CHEMOATTRACTANT FOR BLOOD MONOCYTES, MEMORY T HELPER
CELLS AND EOSINOPHILS. CAUSES THE RELEASE OF HISTAMINE FROM
BASOPHILS AND ACTIVATES EOSINOPHILS (BY SIMILARITY).
-!- SUBCELLULAR LOCATION: Secreted.
-!- SIMILARITY: BELONGS TO THE INTERCRINE BETA FAMILY (SMALL CYTOK).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Oryctolagus cuniculus (Rabbit).

                                                 "Identification of RANTES, MIP-1 alpha, and MIP-1 beta as the major HIV-suppressive factors produced by CD8+ T cells.";
Science 270:1811-1815(1995).
-!- FUNCTION: MONOKINE WITH INFLAMMATORY AND CHEMOKINETIC PROPERTIES.
BINDS TO CCR1, CCR4 AND CCR5. ONE OF THE MAJOR HIV-SUPPRESSIVE FACTORS PRODUCED BY CD8+ T CELLS. RECOMBINANT MIP-1-ALPHA INDUCES A DOSE-DEPENDENT INHIBITION OF DIFFERENT STRAINS OF HIV-1, HIV-2, AND SIMIAN IMMUNODEFICIENCY VIRUS (SIV).
-!- SUBCELLULAR LOCATION: Secreted.
-!- INDUCTION: BY TPA OR PHA (TPA = 12-O-TETRADECANOYL PHORBOL-13 ACETATE (TUMOR PROMOTER); PHA = PHYTOHEMAGGLUTININ (T-CELL MITOGEN)).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        response; Signal; 3D-structure.

```
detecting
Screening for cpds. with anti-heparanase activity - by inhibition of heparin or heparan sulphate degradation, potentially useful for treating arthritis, restenosis,
```

60pp; English Claim 13; Page 51; Purified heparanases, prepared under reducing conditions and activated with transglutaminase, are given in AAR70786-802. Most are prepared by reverse transcription of mRNA from activated human leukocytes, then cloning of the cDNA into pVL1392 baculovirus vector, and expression in Sf9 cells in the presence of reduced glutathione and dithiothreitol.
(Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents the C-C chemokine RANTES. The invention relates to amino-terminally truncated C-C chemokines, having chemokine antagonistic activity. The truncated chemokines are specifically residues 26 to 91 of the RANTES sequence (this sequence) or residues 29 to 99 of the MCP2 sequence (see AAY05300). The new chemokines are useful as medicaments, for diagnosis and/or treatment of diseases which require antagonistic activity of a chemokine e.g. inflammatory diseases, HIV infection, tumours, and angiogenesis- and haematopoiesis-related diseases. The invention also relates to the use of CD26/DPP IV for
                                                                                                                                                                                                                                                                                                                                        9
                                                                                                                                                                                                                                                                                                                                                                               9
     This sequence represents full length human RANTES (Raised on Activation, normal T cell derived and Secreted). The DNA encoding this sequence was cloned from a human bone marrow lambda gtll cDNA library using the primer sequences given in AAT30330-33. RANTES was used in the design of peptides which act as antagonists to RANTES or to MIP-lalpha (see also AAR97666-68). These peptides may be used in the treatment of asthma, allergic rhinitis, atopic dermatitis, atheroma/atherosclerosis or rheumatoid arthritis by inhibiting or reducing inflammation mediated by RANTES or MIP-lalpha. They are also useful in studying RANTES induced chemotaxis, mobilisation of Ca2+ and receptor binding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           C-C chemokine; RANTES; MCP2; chemokine antagonist; inflammatory disease HIV infection; tumour; angiogenesis-related disease; autoimmune disease haematopoiesis-related disease; CD26/DPP IV; immune disease; diagnosis; atherosclerosis; pulmonary disease; skin disorder; therapy.

The invention relates the generation of amino-terminal truncated C-C chemokines, havir chemokine antagonistic activity. The new chemokines are useful as medicaments, for diagnosis and/or treatment of diseases which require antagonistic activity of a chemokine e.g. inflammatory diseases, HIV infection, tumours, and angiogenesis- and hematopoiesis-related diseases, including auto-immune diseases, atherosclerosis, pulmonary diseases and skin disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents the wild type C-C chemokine Regulated on Activation Normal T-cell Expressed and Secreted (RANTES). The invention relates the generation of amino-terminal truncated C-C chemokines, having chemokine antagonistic activity. The new chemokines are useful as medicaments, for diagnosis and/or treatment of diseases which require antagonistic activity of a chemokine e.g. inflammatory diseases, HIV infection, tumours, and angiogenesis- and hematopoiesis-related diseases, including auto-immune diseases, atherosclerosis, pulmonary diseases and skin disorders.
                                                                                                                                                                                                                                                            Wild type; C-C chemokine; monocyte chemotactic protein 2; MCP2; HIV; regulated on activation normal T-cell expressed and secreted; RANTES; truncation; antagonist; medicaments; diagnosis; inflammation; infection; tumour; angiogenesis; hematopoiesis; autoimmune disease; atherosclerosis; pulmonary disease; skin disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             9

```
The invention relates to a cross-over protein produced by chemical ligation of at least two functional protein modules derived from at least two parent protein molecules. The cross-over proteins can be used in two parent protein molecules. The cross-over proteins and infectious diseases including AIDS, and for indications of hematopoiesis and chemoprotection. They are also useful for treatment of asthma, allergic rhinitis, atopic dermatitis and rheumatoid arthritis. A library comprising a collection of cross-over proteins is useful for screening for cross-over proteins that are receptor ligands. The libraries comprise functionally diverse compounds therefore improving the drug discovery process. The proteins and libraries are exemplified by the preparation of cross-over chemokines comprising various combinations of peptide segments derived from RANTES, SDF-1 (stromal cell derived factor 1), vMIP (viral Macrophage Inflammatory protein) and other such chemokines. The present sequence represents a native amino acid fragment of RANTES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New cross-over proteins for treatment of inflammation and infections e.g. AIDS - prepared by ligation of two functional protein modules derived from two different parent molecules
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Chemokine; cross-over protein; pharmaceutical; inflammatory; AIDS; infectious disease; hematopoiesis; chemoprotection; asthma; RANTES; allergic rhinitis; atopic dermatitis; rheumatoid arthritis; SDF-1; stromal cell derived factor 1; Macrophage Inflammatory protein.

                                                 Macrophage recruitment; chemokine derivative; MCP-1; osteoporosis; monocyte chemoattractant protein-1; inflammation; atherosclerosis; HIV; AIDS; stroke; psoriasis; autoimmune disease; hypertension; endotoxaemia; basophil-mediated disease; myocardial infarction; acute ischaemia; rheumatoid arthritis; contraception.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention concerns the identification of a number of chemokines which can be used to produce derivatives, agonists and antagonists which are then useful in disease treatment. The chemokines include sequences AAB15785-B15794, AAB15803-B15813 and AAB15831-B15848. These chemokine derivatives can be used to treat diseases such as autoimmune diseases, atherosclerosis, osteoporosis, HIV infection and AIDS, psoriasis, inflammatory diseases, hypertension, basophil-mediated diseases, endotoxaemia, myocardial infarction, acute ischaemia and rheumatoid arthritis, and can be used to prevent strokes and as contraceptives. The coding sequences for the chemokines can be used in gene therapy for the same diseases, as well as in the production of
                                                                                                                                                                                                                                                                                                                                                                                                                                                 tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              for

.ч О in genet of human polypeptides, useful Nucleic acids encoding a range o vaccination, testing and therapy

765pp; English. 206; Claim 20; Page The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptides and cells genetically the nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. They may be used to therapy, and can be used as nutritional supplements. They may be used in therapy, and can be used as nutritional supplements. They may be used in therapy, and can be used as nutritional supplements, and in bone, cartilage, tendon and/or nerve tissue growth or regeneration; immune suppression and/or stimulation; as anti-inflammatory agents; and in treatment of leukaemias. AAU29510-AAU33304 represent the amino acid sequences of novel human secreted proteins of the invention. for t 0 and

These were derived from expressed sequence tags (ESTs from the organism of interest. They can be used in diagnostics, forensics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence is a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1 MKVSAARLAVILIATALCAPASASPYSSDTTPCCFAYIARPLPRAHIKEYFYTSGKCSNP

and treatment children <u>.</u> RANTES chemokine or an expression system in its of paramyxovirus infection, especially in of paramyxovirus diagnosis of

English. -; 19pp; Claim 5; Page

only The invention relates to the treatment of paramyxovirus infection that involves administration of an active ingredient such as RANTES chemokine (I) or an expression system (II). (I) and (II) are used in the treatment and diagnosis of paramyxoviral infection, especially in children. RANTES chemokine has a significant effect on respiratory infections caused by paramyxovirus. RANTES acts downstream of viral entry and signals through specific CCRI and/or CCR5 chemokine receptors to interrupt the death pathway of macrophages which have been infected by virus. RANTES not only inhibits apoptosis of infected macrophage but also clears the macrophage of infection. The present sequence represents a human RANTES protein. Note: the present sequence is not provided in the specification. It has been obtained from the NCBI database under the accession no. NP_002976.

chemokine mutant), comprising the amino sequence of 91 amino acids as given in the specification. The CC chemokine mutant RANTES, with two mutations in the cationic site is useful for the preparation of a pharmaceutical composition used in treating multiple sclerosis or other demyelinating diseases. The mutant with single mutations at cationic sites is used for the treatment of HIV infection and/or other allergic or inflammatory diseases. This sequence represents the wild-type human RANTES protein of the invention. The invention relates to a truncated and mutated human RANTES

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a truncated and mutated human RANTES (a CC chemokine mutant), comprising the amino sequence of 91 amino acids a given in the specification. The CC chemokine mutant RANTES, with two mutations in the cationic site is useful for the preparation of a pharmaceutical composition used in treating multiple sclerosis or otl demyelinating diseases. The mutant with single mutations at cationic sites is used for the treatment of HIV infection and/or other allerginflammatory diseases. This sequence represents a mutant human RANTER protein of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a truncated and mutated human RANTES (a CC chemokine mutant), comprising the amino sequence of 91 amino acids as given in the specification. The CC chemokine mutant RANTES, with two mutations in the cationic site is useful for the preparation of a pharmaceutical composition used in treating multiple sclerosis or other demyelinating diseases. The mutant with single mutations at cationic sites is used for the treatment of HIV infection and/or other allergic inflammatory diseases. This sequence represents a mutant human RANTES protein of the invention.

04-OCT-2000;

The invention relates to a truncated and mutated human RANTES (a CC chemokine mutant), comprising the amino sequence of 91 amino acids as given in the specification. The CC chemokine mutant RANTES, with two mutations in the cationic site is useful for the preparation of a pharmaceutical composition used in treating multiple sclerosis or other demyelinating diseases. The mutant with single mutations at cationic sites is used for the treatment of HIV infection and/or other allergic or inflammatory diseases. This sequence represents a mutant human RANTES protein of the invention.

GENERAL INFORMATION:
APPLICANT: Lawrence, Papsidero
APPLICANT: Lyn, Dyster
APPLICANT: Lyn, Dyster
APPLICANT: Jana, Frustaci
TITLE OF INVENTION: Detection and Treatment of Breast Cancer
FILE REFRENCE: 3380/11127-US3
CURRENT APPLICATION NUMBER: US/09/834,795A
CURRENT FILING DATE: 1998-09-03
PRIOR FILING DATE: 1998-09-03
PRIOR FILING DATE: 1998-01-20
PRIOR FILING DATE: 1998-01-20
PRIOR FILING DATE: 1998-07-09
NUMBER OF SEQ ID NOS: 35
SOFTWARE: Patentin version 3.0
APPLICANT: Siani, Michael A.
APPLICANT: Wilken, Jill
APPLICANT: Wilken, Jill
APPLICANT: Simon, Reyna
APPLICANT: Simon, Reyna
APPLICANT: Simon, Reyna
APPLICANT: Stephen B.H.
TITLE OF INVENTION: Modular Protein Libraries and Methods of Pre
FILE REFERENCE: GRFN-020/01US
